
Computed over the 11 markers named by prespecification/nbais_inclusion_rule.md; k is how many of them pool within the class.
Error bars are the 2.5th to 97.5th percentiles of the two level bootstrap (10 000 resamples, seed 20261013). Positive values indicate a shift toward a younger biomarker profile.
GLP−1 / GIP / GCG: no biomarker pools within the class, so there is nothing to average.
GLP−1 / GCG (1): fewer than 3 of the 11 markers named by the composite inclusion rule pool within the class, so no composite is computed.
